Self-Priming Centrifugal Pump UHN series (PAT.)

Outstanding self-priming performance even under extreme conditions

Standard centrifugal pumps have no self-priming capability and are incapable of pumping when water flow is discontinued in the suction pipe. The oval shaped self-priming pump has weak self-priming force at locations where back pressure is present, and the higher the pump head, the harder to self-prime the water.

The YOKOTA Self-Priming Centrifugal Pump has the same pumping capability for high head pumping as other centrifugal pumps, however its self-priming force is extremely strong at 500-700mmHg, which enables the pump to be used even under extreme conditions.

For suction pumping with outstanding self-priming power: UHN type

For intake piping across embankments or long intake pipes: Priming strengthened UHNS/UHNK types

For high density slurry: UHT type

For installation in places subject to submersion: UHPR type with submersible motor

Features of the YOKOTA Self-Priming Centrifugal Pump

Outstanding self-priming power

The internationally patented water-air separating mechanism reaches a maximum vacuum of 500-700mmHg (6-9m water column) and displays outstanding self-priming power.

No problem with suction of air during pumping

A large amount of incoming air can be separated and discharged during pumping. Even if pumping becomes subject to suction or mixture of air due to fluctuations of suction conditions, it continues pumping, constantly discharging air, and restores normal pumping operation as soon as suction conditions return to normal. Even continuous suction of air-containing water is possible.

Low NPSH

Even if cavitation develops due to fluctuations of suction conditions such as water level, temperature, or vacuum level on the suction side, this pump can still continue its pumping operation. Therefore, this pump does not require allowance for NPSH, and enables stable pumping operation even under fluctuating suction conditions. It naturally shows outstanding performance for extraction from sealed (vacuum) tanks.

Intake piping across embankments or long intake piping is possible

Because of superior intake power, intake pipes can be installed across embankments. Intake piping with long piping is also possible.

Outstanding pumping performance

This single-suction, single-stage centrifugal pump displays outstanding pumping performance in a wide range of specifications.

Large selection of models, Large selection of materials

This self-priming pump has an incomparably wide variety of models available for easy selection. Further, a wide variety of materials are available, including FC, CAC, SCS and YOKOTA's corrosion and wear resistant special stainless steel casting (YST), to meet the needs of various kinds of liquid.

Construction that can meet a wide range of specifications

Standard constructions include semi-open impellers for small pumps and closed impellers for medium and larger pumps. The impeller has been improved to form ideal blades for high efficiency.

An oil bath lubrication system is adopted for bearings.

Maintenance is easy to perform because construction is simple and the number of parts in the water passage section is minimized.

Stable quality

All special material products are manufactured internally in a continuous process to ensure stable quality.

Principle of self-priming (PAT.)

The pump casing consists of a smaller passage and a larger passage forming a semi-double volute and a cavity holder in the discharge nozzle.

1. Flow of circulation

During self-priming, the water discharged from passage A in the semi-double volute returns to the impeller through passage B-C, and is discharged again into passage A.

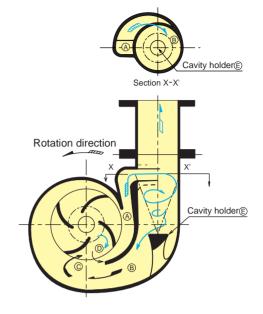

2. Removal of bubbles

This recirculation flow mixes the water and the air in the center with intense vortex D within the impeller and discharges it into passage A.

3. Water-air separation and ex haust

The water-air mixture is led from passage A to discharge nozzle B in a cyclonic state and automatically separated by centrifugal force, and then the water is recirculated through passage B-C.

The separated air is then held by cavity holder E, and compressed and discharged.

Applications

The YOKOTA Self-Priming Centrifugal Pumps can be used even under extreme conditions. They can be used, for example, as condensate pumps, drain pumps, chemical pumps for liquids containing air, and pumps for extraction from sealed tanks.

Chemical industry: Acids, Alkaline liquids, Solvents, Slurry liquids, other

Food industry: Brewery, Sugar refining, other Mining industry: Seawater, Slurry liquids, other

Paper industry: Pulp, Effluent, White water, Black water, other

Electric power: Exhaust gas desulfurizer (Limestone slurry pumps, other), Seawater, Water treatment, other Electronic industry: Ultra-pure water manufacturing devices, Acidic waste water, Polishing waste water treatment, other

Aquarium, Fish farming: Seawater suction, Circulation pumps, other

Others: Hot springs, Hot oil, other

This is a self-priming type pump for suction pumping.

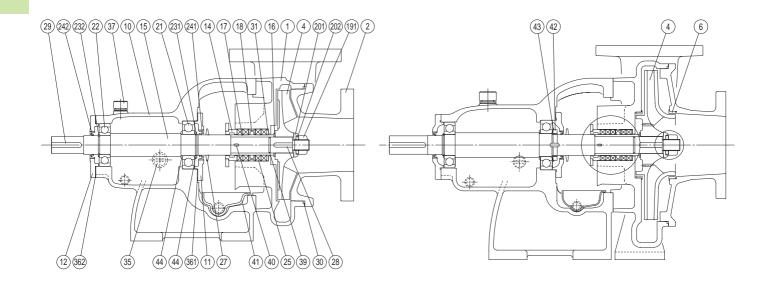

For the non-self-priming type (for force pumping) with similar specifications, please refer to Centrifugal Pump UEN series (P.68).

Bore 40-250mm Total head 10-90m Capacity 0.1-8m³/min

Structure (UHNS/UHNK types, UHT type, UHPR type)

UHNS/UHNK types: Priming strengthened types for intake piping across embankments or long intake pipes

UHNS type:

Water-air separating impeller is installed in the main pump of UHN type to enhance self-priming with vacuum pump.

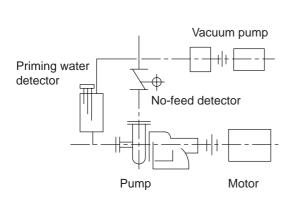

UHNK type:

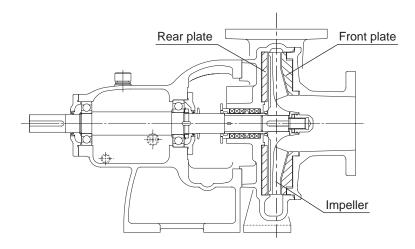

Main pump is standard UHN type.

Self-priming strengthened by vacuum pump in order to reduce self-priming time in long suction piping. Automatic operation with No-Feed Detector and priming-water detector.

UHT type: High corrosion and wear resistance type for high density slurry

The front and rear plates (wear resistant plates) are installed to protect the casing.

Specification: Economical selections can be made from a wide variety of models similar to the UHN type.

Performance: Impeller configuration can be selected depending on use.

Material: A wide variety of materials, such as YOKOTA's corrosion and wear resistant special stainless

steel casting (YST), are available.

Construction: Wear resistant plates are installed for handling high density slurry.

Shaft seal: Gland packing, mechanical seals, Non-External-Flushing Mechanical Seals can be selected

depending on use.

UHPR type: Combined with submersible motor for installation in places subject to submersion

For installing pumps in such places as floodplains or basements, where there is a possibility of submersion, it is safer to use the UHPR type composed of a UHN type pump and submersible motor which is trouble-free in such situations.

For details on related dimensional outline drawings, please contact us.

To make the best use of the features of the UHN type, please follow the items below.

Installation and piping

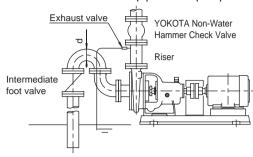

- 1. The pump sucks water in the axial direction. Be sure to install an inverse U-bent pipe in the suction piping as shown in the figure below.
- 2. The pump, being a self-priming type, does not require installation of an intermediate valve or a foot valve in ordinary operating conditions. However, if frequent operation or shorter self-priming time is desired, we recommend installing such valves. The purpose is to keep as much water as possible in the pump. The valve need not function perfectly and minor leakage will not affect performance.
- 3. If a gland packing is used for shaft sealing, we recommend installation of an external flusher to prevent air from being sucked during self-priming and to maintain efficiency of the gland packing.
- 4. When the pump is started up, the water inside the casing is discharged once into the discharge side before returning to the casing, and then stabilizes after recirculation begins. If the discharged water floods the check valve and the bent pipe, the amount of recirculating water becomes insufficient and self-priming efficiency decreases. Therefore, be sure to install a riser of the height shown in the figure below. For situations where the riser is too long for installation, we can provide a short discharge pipe (h2) which is made of the same material as the casing and has a special construction. Please contact us for more details.
- 5. Be sure to install a check valve on the discharge side of the pump. We recommend the YOKOTA Non-Water Hammer Check Valve to prevent water hammer due to reverse flow when pump operation is stopped. Particularly with parallel operation, when one pump is stopped, it will be subject to back pressure from the other pump, causing water hammer. The YOKOTA Non-Water Hammer Check Valve can prevent water hammer even in such a situation. Further, attachment of the YOKOTA No-Feed Detector (Optional) can prevent the pump from dry operation.
- 6. If the pumps are under parallel operation or if the actual pump head above the check valve exceeds more than 1/3 of the shut off head, back pressure acts on the check valve, making it difficult to exhaust air. Install an exhaust valve to relieve such a situation. In this case, install a suitable socket (refer to the table below) on the riser at the highest possible position (refer to " J" in the figure below), and then install the exhaust valve so that the opening end of its suction part is in the center of the riser bore.

There may be water leakage from the exhaust valve. To prevent air from being sucked when operation is stopped, install a pipe from the exhaust valve to a point below the water level of the suction side.

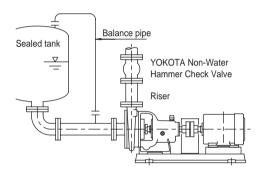

For slurry liquid pumping, please contact us.

Piping layout ex amples

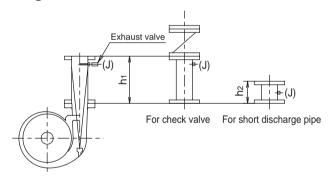

Example 1.
Self-priming suction operation
Attach the inverse U-bent pipe to the pump.

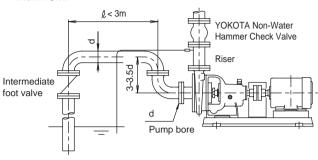

Example 2. Sealed tank (vacuum tank) extraction operation

Length of riser

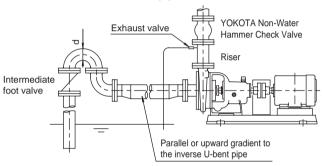

Limit the extension of the inverse U-bent pipe (L) within 3m.

Example 3.

Self-priming suction operation with long horizontal pipe Attach the inverse U-bent pipe.

Length of riser

 $h_1 >= 200 + d + 5H$ (Total head of pump =< 50m) $h_1 >= 300 + d + 5H$ (Total head of pump > 50m) Where

h1 : Length of riser (mm)d : Discharge bore (mm)H : Total head of pump (m)

Example:

UHN-0520 50mm x 0.3m³/min. x 22m x 1750rpm x 3.7kW h1 >= 200 + (50) + (5x22) = 360

Use a riser of over 360mm length, desirably over 500mm. For slurry liquid pumping, please contact us.

Note:

- Standard accessories: Common base plate, Shaft coupling, Foundation bolts and Safety cover.
 Base plate with dimension L larger than 1600mm is made of steel plate.
 (*) For the 2P, pump type is UHNM-1010, and the bracket No. is 145.
 Outer dimensions refer only to electric motors at maximum motor output (at 60Hz), therefore there may be differences in outer dimensions. For details on related dimensional outline drawings, please contact us.

Patented in Japan, U.S.A., other

Bore 40-250mm Total head 10-90m Capacity 0.1-8m³/min

Selection chart UHNS type

Model number explanation XXXX-##@@-xP(* *)
XXXX : Pump type

: Suction/Discharge bore (cm)

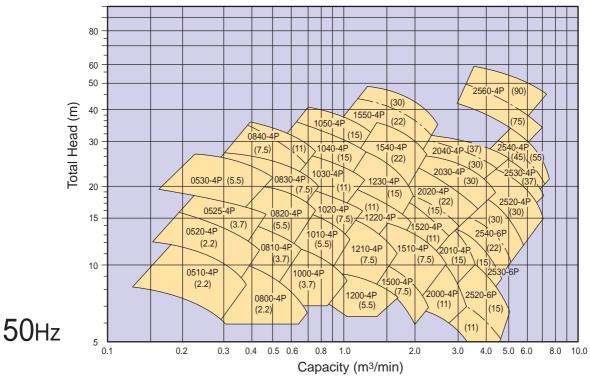

@@ : Head classification

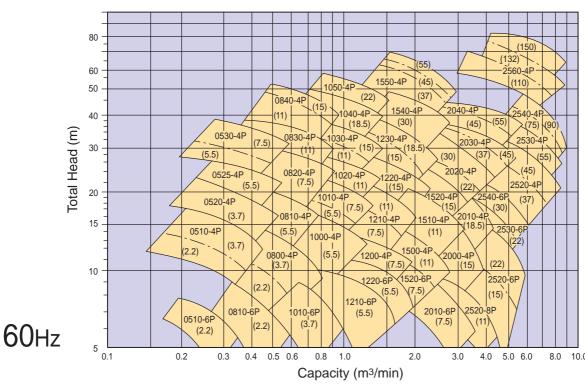

xP : Electric motor pole number (2P, 4P, 6P, other)

(* *) : Electric motor output power (kW) at maximum performance (using normal water at normal temperature)

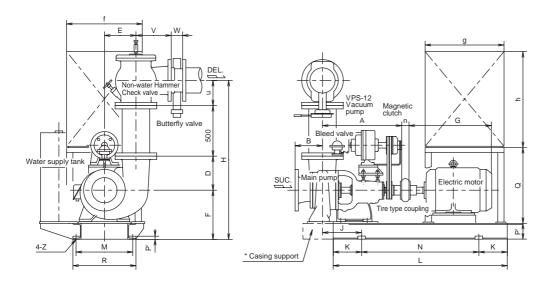

Please contact us for details concerning specifications not indicated in this chart.

Motor output power in this chart includes power for simultaneous operation of the Vacuum Pump VP-S12.
